

Mobile Versions of REFLECT

REFLECT PDA

This is designed to work with Windows Mobile 2003 or above and needs to be installed on your device. REFLECT PDA allows you to access existing assets and to create new ones when you are away from a computer or an internet connection.

As REFLECT PDA runs as a programme on your Smartphone/PDA you can create and save assets locally and later synchronise assets between your online account and your mobile device using a wired connection/cradle or through WiFi or other wireless connection.

REFLECT SendR

This is a simple java application which you download and run on your phone. Once installed you can select any file on your phone and upload it directly to your REFLECT account. When you select a file to upload through SendR it will open a data connection to your online REFLECT account. Bigger files will take longer to upload and you may pay more for the data you use on your phone.

REFLECT Mobile

There is a very simple version of REFLECT which you can access through any mobile browser. REFLECT Mobile allows you to access existing assets and to create some types of new ones. Your phone/mobile device will need to be online to use to use REFLECT Mobile.

Further information including download instructions and tipsheets can be found at:
